ANNEX 9 - SIMULATION EXERCISE

Provision of a dashboard to publish and maintain aggregated country-relevant data

Country-related information is currently distributed across several locations on the EASA website. The objective of this simulation exercise is to provide visitors with a dedicated, user-friendly dashboard that aggregates relevant country-specific information and enables intuitive navigation and discovery on a per-country basis.

For the purposes of this simulation exercise, the dashboard shall aggregate data and information from the following four existing EASA pages:

- **International cooperation:** https://www.easa.europa.eu/en/domains/international-cooperation/easa-by-country
- **Conflict zones (CZIBs):** https://www.easa.europa.eu/en/domains/air-operations/czibs
- **Civil drones (NAAs):** https://www.easa.europa.eu/en/domains/civil-drones/naa
- **EASA member states:** https://www.easa.europa.eu/en/light/topics/easa-member-states

Required deliverables for the simulation exercise:

1. Simulation exercise: Mock-ups for desktop and mobile

The Agency requires a visually appealing, user-friendly, and accessible dashboard optimised for both desktop and mobile devices.

The proposed mock-ups shall demonstrate, at a minimum, the following core functionalities:

i. **Map display:** A geographical representation of the country-related information shall be provided. The map should enable users to identify and explore relevant information by country through user-friendly interface.

The proposed solution should demonstrate how different categories of country-related information can be represented and accessed through the map, while ensuring that the visualisation remains clear and usable across desktop and mobile screen sizes.

ii. **Table display:** The dashboard shall provide a structured, tabular representation of the available country-related information.

The table should support user-friendly browsing and comparison of information and, where relevant, provide direct access to detailed country-specific content and external sources.

iii. **Search and filter:** The dashboard shall include:

- Free-text search functionality;
- Advanced filtering capabilities;
- Filtering by country and relevant categories of information;
- Clear visualisation of active filters;
- Easy reset and refinement of search criteria.

Search and filtering functionality shall be easy to use and operate consistently across the map and table views, allowing users to efficiently locate relevant information.

iv. **Stay informed and personalisation options:**

The dashboard shall integrate with EASA's existing registration, notification, and personalisation services. For additional context, please refer to: https://www.easa.europa.eu/en/stayinformed/all).

The technical offer shall explain the usability best practices followed.
The target audience to be considered for these mock-ups includes both aviation professionals and general public. The tenderer shall propose how anonymous users will be engaged with and how they will be onboarded to become registered users.

The tenderer shall propose and demonstrate how the dashboard will enable registered users to personalise their experience and increase the visibility when new country related information is published.

2. Simulation exercise: Content and data management

- **Enhanced content management:** The tenderer shall make a detailed proposal for managing the data required. This must address how to easily manage or validate both data owned by EASA (e.g., CZIBs) and data not owned by EASA (e.g., links to external Civil Aviation Authority websites for civil drones), minimising human intervention. The proposal should specifically outline how artificial intelligence (AI) can be utilised to initially populate the dashboard and how to update the content over time, validate the correctness of the published information, and continuously check its validity over time.

- **Data management strategy:** Tenderers shall provide a proposal detailing how they intend to set up the data management system for this simulation. This shall address the architecture for managing, synchronizing, and exposing data to third-party services. Tenderers shall propose a solution that allows the published content and data to be easily consumed by other external web services (e.g., via APIs).

- **Technical infrastructure overview:** A detailed overview of the technical infrastructure required to build and maintain the dashboard. This should include all necessary underlying services, such as AI components, analytics, email marketing, and personalisation services.

  For this simulation, tenderers shall assume an average traffic load of 50,000 pageviews per day. The proposed architecture shall demonstrate high availability 99.95% uptime, Recovery Point Objective (RPO) shall be less than 1 hour, Recovery Time Objective (RTO) less than 4 hours. Comprehensive monitoring and the ability to auto-scale during unexpected traffic spikes.

3. Simulation exercise: Team composition and communication

For the simulation exercise, the tenderer shall provide the following:

- detailed description regarding their proposed team composition, including the relevant experience of each team member responsible for delivering and maintaining the dashboard,

- the tenderer shall describe the proposed communication and collaboration workflows between EASA and their team, specifying the tools that will be used.
